

NeuraFlow AI

The Operating System for Enterprise AI Agents

Series A | Confidential | Prepared for Together Fund

The Problem

Enterprises are drowning in disconnected AI pilots

- 68% of enterprise AI agent pilots never reach production (internal survey, 40 F500 companies)
- Average enterprise runs 6-9 siloed agent frameworks with no shared memory or orchestration
- Compliance and audit teams have no visibility into what agents actually decided, or why
- Existing orchestration tools (LangGraph, CrewAI) require deep in-house ML engineering to harden for product

Our Solution

A single control plane for every enterprise AI agent

- NeuraFlow sits between existing agent frameworks and enterprise infrastructure
- One deployment, full audit trail, cross-agent shared memory, built-in compliance logging
- Enterprises plug in agents built on any framework - we don't replace their stack, we govern it
- Deployed today across procurement, customer support, and internal engineering copilot use cases

Technology

Proprietary foundation model, purpose-built for orchestration

- NeuraFlow-1: a 7B parameter foundation model trained from scratch on 50M+ enterprise workflow traces
- Not a fine-tune of an existing open-weight model - our own pretraining run, our own tokenizer
- Custom Rust-based orchestration runtime achieves sub-100ms agent handoff latency
- Model natively understands enterprise workflow graphs, not just natural language

Note: pretraining compute details available under NDA.

Data Moat

Exclusive access no competitor can replicate

- 12M+ anonymized enterprise workflow logs collected via 14-month pilot program with 6 Fortune 500 companies
- Exclusive data-sharing agreements with 3 of the 6 pilot customers, renewed annually
- This workflow-log corpus does not exist anywhere else - it is the core defensibility of NeuraFlow-1
- Competitors relying on public agent-trace datasets cannot match our task-completion accuracy (94% vs. 71%)

Why We Win

Three moats, reinforcing each other

- Data: proprietary enterprise workflow corpus, exclusive pilot agreements
- Model: purpose-built architecture, not a wrapper on GPT-4/Claude/Llama
- Distribution: embedded in customer procurement + compliance workflows from day one
- Combined effect: 3-4x higher task-completion accuracy than framework-only competitors

Traction

Early revenue, strong logo quality

- \$1.2M ARR, up from \$180K six months ago
- 6 enterprise pilots (3 converted to paid), average contract value \$340K/year
- Design partners span fintech, healthcare, and logistics verticals
- 14-person team, engineering-heavy, founders ex-Google DeepMind and ex-Flipkart

The Ask

Raising \$8M Series A

- \$8M to expand go-to-market in the US, double engineering headcount
- 18-month runway to \$6M ARR and Series B readiness
- Seeking partners with operator experience scaling enterprise AI GTM in the US-India corridor
